### 10.399.1 Detailed Description

PatientRootQuery.

contains: the class which will produce a dataset for c-find with patient root

### 10.399.2 Constructor & Destructor Documentation

#### 10.399.2.1 WLMFindQuery()

```
gdcm::WLMFindQuery::WLMFindQuery ()
```

### 10.399.3 Member Function Documentation

#### 10.399.3.1 GetAbstractSyntaxUID()

```
UIDs::TSName gdcm::WLMFindQuery::GetAbstractSyntaxUID () const [override], [virtual]
```

Implements [gdcm::BaseQuery](#).

#### 10.399.3.2 GetTagListByLevel()

```
std::vector< Tag > gdcm::WLMFindQuery::GetTagListByLevel (
    const EQueryLevel & inQueryLevel) [override], [virtual]
```

this function will return all tags at a given query level, so that they maybe selected for searching. The boolean forFind is true if the query is a find query, or false for a move query.

Implements [gdcm::BaseRootQuery](#).

#### 10.399.3.3 GetValidDataSet()

```
DataSet gdcm::WLMFindQuery::GetValidDataSet () const [protected]
```

#### 10.399.3.4 InitializeDataSet()

```
void gdcm::WLMFindQuery::InitializeDataSet (
    const EQueryLevel & inQueryLevel) [override], [virtual]
```

this function sets tag 8,52 to the appropriate value based on query level also fills in the right unique tags, as per the standard's requirements should allow for connection with dcmTk

Implements [gdcm::BaseRootQuery](#).

### 10.399.3.5 ValidateQuery()

```
bool gdcm::WLMFindQuery::ValidateQuery (
    bool inStrict = true) const [override], [virtual]
```

have to be able to ensure that 0x8,0x52 is set (which will be true if InitializeDataSet is called...) that the level is appropriate (ie, not setting PATIENT for a study query that the tags in the query match the right level (either required, unique, optional) by default, this function checks to see if the query is for finding, which is more permissive than for moving. For moving, only the unique tags are allowed. 10 Jan 2011: adding in the 'strict' mode. according to the standard (at least, how I've read it), only tags for a particular level should be allowed in a particular query (ie, just series level tags in a series level query). However, it seems that dcm4chee doesn't share that interpretation. So, if 'inStrict' is false, then tags from the current level and all higher levels are now considered valid. So, if you're doing a non-strict series-level query, tags from the patient and study level can be passed along as well.

Implements [gdcm::BaseRootQuery](#).

## 10.400.1 Detailed Description

[Writer](#) ala DOM (Document [Object](#) Model)

This class is a non-validating writer, it will only performs well- formedness check only.

Detailed description here To avoid GDCM being yet another broken DICOM lib we try to be user level and avoid writing illegal stuff (odd length, non-zero value for [Item](#) start/end length ...) Therefore you cannot (well unless you are really smart) write DICOM with even length tag. All the checks are consider basics:

- Correct Meta Information Header (see [gdcm::FileMetaInformation](#))
- Zero value for [Item](#) Length (0xfffe, 0xe00d/0xe0dd)
- Even length for any elements
- Alphabetical order for elements (guaranteed by design of internals)
- 32bits [VR](#) will be rewritten with 00

### Warning

[gdcm::Writer](#) cannot write a [DataSet](#) if no SOP Instance UID (0008,0018) is found, unless a [DICOMDIR](#) is being written out

- `#define GDCM_LEGACY_REPLACED_BODY(method, version, replace)`
- `#define GDCM_NOOP_STATEMENT static_assert(true, "")`

## 11.39.1 Macro Definition Documentation

### 11.39.1.1 GDCM\_LEGACY

```
#define GDCM_LEGACY(  
    method)
```

#### Value:

```
method;
```

### 11.39.1.2 GDCM\_LEGACY\_BODY

```
#define GDCM_LEGACY_BODY(  
    method,  
    version)
```

#### Value:

```
gdcmlWarningMacro(#method " was deprecated for " version " and will be removed in a future version.")
```

### 11.39.1.3 GDCM\_LEGACY\_REPLACED\_BODY

```
#define GDCM_LEGACY_REPLACED_BODY(
    method,
    version,
    replace)
```

#### Value:

```
gdcmWarningMacro(#method " was deprecated for " version " and will be removed in a future version. Use "
    #replace " instead.")
```

### 11.39.1.4 GDCM\_NOOP\_STATEMENT

```
#define GDCM_NOOP_STATEMENT static_assert(true, "")
```

The `static_assert(true, "")` idiom is commonly employed for C++11 or greater to ensure that it is compile-time only check that can not be part of the binary file. This allows a macro to be used anywhere that a statement is expected, and to enforce consistent use of ; after a macro. The `static_assert` is a `constexpr` that can be used in places where raw statements (i.e. `'do{} while(0)'`) are not allowed (i.e. after class member function definitions).

## 11.61.1 Macro Definition Documentation

### 11.61.1.1 GDCM\_DO\_JOIN

```
#define GDCM_DO_JOIN(  
    X,  
    Y)
```

**Value:**

`GDCM_DO_JOIN2(X, Y)`

### 11.61.1.2 GDCM\_DO\_JOIN2

```
#define GDCM_DO_JOIN2(  
    X,  
    Y)
```

**Value:**

`X##Y`

### 11.61.1.3 GDCM\_JOIN

```
#define GDCM_JOIN(  
    X,  
    Y)
```

**Value:**

`GDCM_DO_JOIN( X, Y )`

### 11.61.1.4 GDCM\_STATIC\_ASSERT

```
#define GDCM_STATIC_ASSERT(  
    B)
```

**Value:**

```
typedef ::gdcm::static_assert_test<\n    sizeof(::gdcm::STATIC_ASSERTION_FAILURE< (bool) ( B ) >)>\n    GDCM_JOIN(gdcm_static_assert_typedef_, __LINE__)
```

The `GDCM_JOIN + LINE` is needed to create a uniq identifier.

### 11.79.1.1 GDCM\_FUNCTION

```
#define GDCM_FUNCTION "<unknown>"
```

### 11.79.1.2 gdcmAssertAlwaysMacro

```
#define gdcmAssertAlwaysMacro(  
    arg)
```

#### Value:

`gdcmAssertMacro(arg)`

`AssertAlways.`

#### Parameters

<i>arg</i>	argument to test An easy solution to pass also a message is to do: <code>gdcmAssertMacro( "my message" &amp;&amp; 2 &lt; 3 )</code>
------------	---

Referenced by `gdcm::DataElement::GetValue()`, `gdcm::DataElement::GetValue()`, `gdcm::BasicOffsetTable::Read()`, `gdcm::SequenceOfFragments::ReadValue()`, `gdcm::DataSet::Replace()`, `gdcm::DataSet::ReplaceEmpty()`, and `gdcm::VR::Write()`.

### 11.79.1.3 gdcmAssertMacro

```
#define gdcmAssertMacro(

## 11.193.1 Macro Definition Documentation

### 11.193.1.1 TYPETOENCODING

```
#define TYPETOENCODING(
    type,
    rep,
    rtype)
```

#### Value:

```
template<> struct VRToEncoding<VR::type> \
{ enum:long long { Mode = VR::rep }; }; \
template<> struct VRToType<VR::type> \
{ typedef rtype Type; };
```

### 11.193.1.2 VRTypeTemplateCase

```
#define VRTypeTemplateCase(
    type)
```

#### Value:

```
case VR::type: \
    return sizeof ( VRToType<VR::type>::Type );
```

#include "gdcmTypes.h"

Include dependency graph for gdcmDefinedTerms.h:

### Classes

- class `gdcm::DefinedTerms`

Defined Terms are used when the specified explicit Values may be extended by implementors to include additional new Values. These new Values shall be specified in the Conformance Statement (see PS 3.2) and shall not have the same meaning as currently defined Values in this standard. A Data [Element](#) with Defined Terms that does not contain a [Value](#) equivalent to one of the Values currently specified in this standard shall not be considered to have an invalid value. Note: Interpretation [Type](#) ID (4008,0210) is an example of a Data [Element](#) having Defined Terms. It is defined to have a [Value](#) that may be one of the set of standard Values; REPORT or AMENDMENT (see PS 3.3). Because this Data [Element](#) has Defined Terms other Interpretation [Type](#) IDs may be defined by the implementor.

The diagram illustrates the relationship between the header files. At the top is a box labeled `gdcPrinter.h`. Below it are two boxes: `gdcDictPrinter.h` on the left and `gdcDumper.h` on the right. Blue arrows point from each of these bottom boxes up to the `gdcPrinter.h` box, indicating that both `gdcDictPrinter.h` and `gdcDumper.h` inherit from or are derived from `gdcPrinter.h`.

00016 // vtkGDCMImageReader is a source object that reads some DICOM files
00017 // this reader is single threaded.
00018 // .SECTION Implementation note: when FileLowerLeft is set to on the image is not flipped
00019 // upside down as VTK would expect, use this option only if you know what you are doing.
00020 // .SECTION Implementation note: when reading a series of 2D slices, user is
00021 // expected to provide an ordered list of filenames. No sorting will be applied afterward.
00022 // .SECTION Implementation note: Although 99% of the time the Zspacing as read
00023 // from a tag in a 2D DICOM file should be correct, there has been reports that this
00024 // value can be missing, or incorrect, in which case users are advised to override this
00025 // value using the return value from gdcm::IPPSorter::GetZSpacing() and set it via
00026 // vtkImageChangeInformation on the reader itself.
00027 // .SECTION TODO
00028 // This reader does not handle a series of 3D images, only a single 3D (multi frame) or a

00036 // file)
00037 // .SECTION DataOrigin
00038 // When the reader is instantiated with FileLowerLeftOn the DataOrigin and Image Position (Patient) are
00039 // identical. But when FileLowerLeft is Off, we have to reorder the Y-line of the image, and thus the
00040 // DataOrigin
00041 // is then translated to the other side of the image.
00042 // .SECTION Spacing
00043 // When reading a 3D volume, the spacing along the Z dimension might be negative (so as to respect
00044 // up-side-down)
00045 // as specified in the Image Orientation (Patient) tag. When Z-spacing is 0, this means the multi-frame
00046 // object

00036 // .SECTION DataOrigin
00037 // When the reader is instantiated with FileLowerLeftOn the DataOrigin and Image Position (Patient) are
00038 // identical. But when FileLowerLeft is Off, we have to reorder the Y-line of the image, and thus the

00014 // .NAME vtkImageColorViewer - Display a 2D image.
00015 // .SECTION Description
00016 // vtkImageColorViewer is a convenience class for displaying a 2D image. It
00017 // packages up the functionality found in vtkRenderWindow, vtkRenderer,
00018 // vtkImageActor and vtkImageMapToWindowLevelColors into a single easy to use
00019 // class. This class also creates an image interactor style
00020 // (vtkInteractorStyleImage) that allows zooming and panning of images, and
00021 // supports interactive window/level operations on the image. Note that
00022 // vtkImageColorViewer is simply a wrapper around these classes.
00023 //
00024 // vtkImageColorViewer uses the 3D rendering and texture mapping engine
00025 // to draw an image on a plane. This allows for rapid rendering,
00026 // zooming, and panning. The image is placed in the 3D scene at a
00027 // depth based on the z-coordinate of the particular image slice. Each
00028 // call to SetSlice() changes the image data (slice) displayed AND
00029 // changes the depth of the displayed slice in the 3D scene. This can
00030 // be controlled by the AutoAdjustCameraClippingRange ivar of the
00031 // InteractorStyle member.
00032 //
00033 // It is possible to mix images and geometry, using the methods:
00034 //
00035 // viewer->SetInput( myImage );
00036 // viewer->GetRenderer()->AddActor( myActor );
00037 //
00038 // This can be used to annotate an image with a PolyData of "edges" or

```

```

00039 // or highlight sections of an image or display a 3D isosurface
00040 // with a slice from the volume, etc. Any portions of your geometry
00041 // that are in front of the displayed slice will be visible; any
00042 // portions of your geometry that are behind the displayed slice will
00043 // be obscured. A more general framework (with respect to viewing
00044 // direction) for achieving this effect is provided by the
00045 // vtkImagePlaneWidget .
00046 //
00047 // Note that pressing 'r' will reset the window/level and pressing
00048 // shift+'r' or control+'r' will reset the camera.

## Classes

- class [gdcm::PythonFilter](#)

*PythonFilter PythonFilter* is the class that make *gdcm2.x* looks more like *gdcm1* and transform the binary blob contained in a *DataElement* into a string, typically this is a nice feature to have for wrapped language.

* Description:
*
* Assume we have a file angiogram-06.dcm as described above.
* the following program will decompress directly from the extracted jpeg stream.
*
* First step extract the jpeg stream (but not the Basic Offset Table):
*
* $ gdcmrw -i angiogram-06.dcm -o /tmp/output/chris --split-frags --pattern %d.jpg
*
* Check that indeed there are 355 files, while there are 356 fragments in the original DICOM file, since
* gdcmrw always skip the first fragment (Basic Offset Table).
*
* Now from those individual jpeg stream, recreate a fake gdcm.DataElement...
*
* Usage:
*
* $ export LD_LIBRARY_PATH=$HOME/Projects/gdcm/debug-gcc/bin
* $ mono ./bin/DecompressImageMultiframe.exe /tmp/output

Question:

1. There is no restriction for a specific Private Creator Data Element (PCDE) to be unique within the same group, right ?

Decoders of Private Data would have to handle the case where a PCDE would be repeated and should NOT stop on the first instance of a particular PCDE, right ?

Eg. when searching for the tag associated with (0x0029,0x0010,"SIEMENS CSA HEADER") in the following (pseudo) dataset:

```

one should return two instances, correct ?

Answer:

I would say that this is covered in principle by the PS 3.5 7.1 "The Data Elements ... shall occur at most once in a Data Set" rule, since the data element is defined by the tuple (private creator,gggg,ee) where xxee is the element number and xx is arbitrary and has no inherent meaning and does not serve to disambiguate the data element.

E.g.:

```
(0019,0030) Private Creator ID = "Smith"
...
(0019,0032) Private Creator ID = "Smith"
...
(0019,3015) Fractal Index = "32"
...
(0019,3215) Fractal Index = "32"
```

would be illegal because even though they are assigned different (completely arbitrary) blocks, with the same group, element number and private creator, (0019,3015) and (0019,3215) are the "same" data element.
